Experience

Shopify | Remote *Oct 2021 – Present*
Staff Engineer, Security Engineering

Employee authentication and authorization platform (Go, Ruby on Rails, Terraform, GCP)

Credential broker: local and headless authentication for developers

- Command-line tools used to fake a browser login; now credentials arrive instantly, with no pop-up and no waiting.
- Gated each token on six checks: user credential, device certificate, device-user match, origin, posture, identity.
- Put package registries, cloud providers, internal APIs, and CI behind one path, so access is revoked in one place.
- Shipped the product end to end: an on-device daemon, device enrollment, an admin interface, and a token service.

Authorization service for internally hosted applications

- Built the front door for internal applications, verifying who you are through Okta before a request reaches the app.
- Kept it off the request path, so an auth outage cannot take down every internal application at once.
- Gave teams a protected front door by configuration, so nobody has to write their own login and get it wrong.

Device-bound single sign-on sessions (Ruby on Rails, Chrome)

- Led the company's first production deployment of Device-Bound Session Credentials.
- Bound sessions to on-device hardware keys, making a stolen session cookie worthless off the device.
- Filed three issues against the W3C specification and resolved them with Chrome's engineers.
- Caught and fixed a replay vector before rollout, verified against hijacked sessions with the red team.

Multi-party approval for privileged production access (Go, TypeScript, React)

- Made privileged production access need a second person's approval, so no one can quietly widen their own access.
- Championed it end to end: three competing prototypes, the CISO decision review, and the interface people use.
- Rolled out to the entire company in eight days, with breakglass procedures and graceful degradation.

Earlier: identity, access, and internal support platforms (Ruby on Rails, React, GCP)

- Automated employee offboarding end to end, from 15–20 minutes of specialist work per exit to none.
- Gated new-hire account activation on government-ID verification, so only the actual hire can claim the account.
- Rebuilt the internal support platform that routes and tracks 7K help requests a week across 890 channels.
- Mentored interns and turned product requirements into work developers could pick up.

Ubisoft | Montreal, QC *Jan 2020 – Aug 2020*
Online Programmer Intern

- Built cloud-based microservices in Go for the Online Development team, on Docker and Kubernetes.
- Shipped to multiple cloud providers through automated GitLab CI pipelines.

Modulis VoIP | Montreal, QC *May 2019 – Dec 2019*
Software Developer Intern

- Designed a microservice architecture and built full-stack features in Ruby on Rails and Vue.js.
- Automated the CI/CD pipelines on Google Cloud Platform with Docker, NGINX, and Kubernetes.

Skills

Product & design: Design docs, prototypes, UX design (Figma), user research, phased rollouts, adoption metrics

Programming (proficient): Go, Ruby (Rails), TypeScript/JavaScript (React, Node), SQL, HTML/CSS

Programming (familiar): Python, Swift, Java, C, GraphQL

Security: OAuth 2.0/OIDC, SAML, JWT/JWKS, mTLS and PKI, DBSC, device trust and posture, Okta, threat modelling

Infrastructure: GCP, Kubernetes, Terraform, Docker, MySQL, Redis

AI: MCP servers and agentic tooling, LLM evaluation, RAG and vector search

Languages: English (native), Arabic (native), French (working proficiency)

Hobbies: Martial arts, leathercraft, hiking, tinkering

Education

McGill University | Bachelor of Science, Computer Science. Development lead, Compete McGill *Sept 2018 – Dec 2021*

University of Ottawa | Bachelor of Science, Honours Biology. Dean's Honour Roll *Sept 2017 – May 2018*

Projects

Atlas | GitHub repo. Open-source Go code generator that scaffolds Express and TypeScript APIs. *2020 – Present*
